**Global automotive retailer
moves mission-critical
application to eCloud.**

Background

In late 2019, Eloquent were approached by PSA Groupe to improve the performance and resilience of a critical email platform used by all Citroen, Peugeot and DS Dealers across the UK.

Our initial engagement was a consultancy workload, investigating and analysing the current solution with a view to reducing risk, whilst increasing performance and resilience through re-design

Performance improvements were delivered by migrating the application to the Eloquent private eCloud platform, built from the ground up specifically for **performance** and **low latency applications**.

The migration, working hand in hand with the internal PSA Team and their 3rd Party application providers, was fully managed and executed by a Team of Eloquent Engineers on a Saturday night/ Sunday morning to ensure no interruption of services to the users.

To ensure implementation of a resilient solution, we implemented Zerto, delivering real time replication of the primary server into a second location providing **geographical diversity**. This works hand in hand with Veeam Backup for data retention and a **fully secured hosted firewall instance**.

We are now investigating further mission critical applications, assessing their suitability for migration to eCloud, with a longer-term strategic aim of further improving the resilience, security and performance that this global Organisation demands.
